Executive Summary

Summary of methodologies

- · Data Collection through API
- · Data Collection with Web Scraping
- Data Wrangling
- · Exploratory Data Analysis with SQL
- Exploratory Data Analysis with Data Visualization
- · Interactive Visual Analytics with Folium
- Machine Learning Prediction

Summary of all results

- Exploratory Data Analysis result
- Interactive analytics in screenshots
- Predictive analytics result from Marchine Learning Lab

Introduction

SpaceX is a revolutionary company who has disrupt the space industry by offering a rocket launches specifically Falcon 9 as low as 62 million dollars; while other providers cost upward of 165 million dollar each. Most of this saving thanks to SpaceX astounding idea to reuse the first stage of the launch by reland the rocket to be used on the next mission. Repeating this process will make the price down even further. As a data scientist of a startup rivaling SpaceX, the goal of this project is to create the machine learning pipeline to predict the landing outcome of the first stage in the future. This project is crucial in identifying the right price to bid against SpaceX for a rocket launch.

The problems included:

- Identifying all factors that influence the landing outcome.
- The relationship between each variables and how it is affecting the outcome.
 - The best condition needed to increase the probability of successful landing.
- Identifying all factors that influence the landing outcome.

Methodology

Executive Summary

- Data collection methodology:
 - Data was collected using SpaceX REST API and web scrapping from Wikipedia
- Perform data wrangling
 - Data was processed using one-hot encoding for categorical features
 - Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - How to build, tune, evaluate classification models

Data Collection

Data collection is the process of gathering and measuring information on targeted variables in an established system, which then enables one to answer relevant questions and evaluate outcomes. As mentioned, the dataset was collected by REST API and Web Scrapping from Wikipedia

For REST API, its started by using the get request. Then, we decoded the response content as Json and turn it into a pandas dataframe using json_normalize(). We then cleaned the data, checked for missing values and fill with whatever needed.

For web scrapping, we will use the BeautifulSoup to extract the launch records as HTML table, parse the table and convert it to a pandas dataframe for further analysis

Data Collection – SpaceX API

Get request for rocket launch data using API

Use json_normalize method to convert json result to dataframe

Performed data cleaning and filling the missing value

```
spacex_url="https://api.spacexdata.com/v4/launches/past"

response = requests.get(spacex_url)

# Use json_normalize meethod to convert the json result into a dataframe data = pd.json_normalize(response.json())

# Lets take a subset of our dataframe keeping only the features we want a nd the flight number, and date_utc.
data = data[['rocket', 'payloads', 'launchpad', 'cores', 'flight_number', 'date_utc']]

# We will remove rows with multiple cores because those are falcon rocket s with 2 extra rocket boosters and rows that have multiple payloads in a single rocket.
data = data[data['cores'].map(len)==1]
data = data[data['payloads'].map(len)==1]
```

https://github.com/lessabruno/Data-Science-Capstone/blob/main/Data-Collection.ipynb

Data Collection - Scraping

```
# use requests.get() method with the provided static url
# assign the response to a object
data = requests.get(static url).text
# Use BeautifulSoup() to create a BeautifulSoup object from a response te
xt content
soup = BeautifulSoup(data, 'html.parser')
extracted row = 0
#Extract each table
for table number, table in enumerate(soup.find all('table', "wikitable plai
nrowheaders collapsible")):
   # get table row
    for rows in table.find all("tr"):
        #check to see if first table heading is as number corresponding t
o launch a number
        if rows.th:
            if rows.th.string:
                flight number=rows.th.string.strip()
                flag=flight number.isdigit()
        else:
                                                       https://github.com/lessabruno/Data-Science-
            flag=False
                                                       Capstone/blob/main/Data Collection with Web Scraping.ipynb
```

Request the Falcon9 Launch Wiki page from url

Create a BeautifulSoup from the HTML response

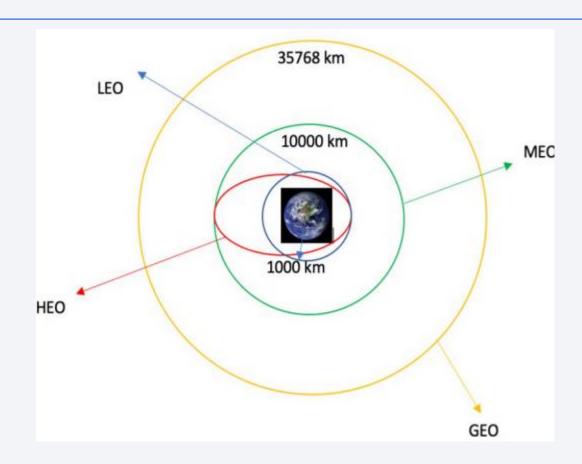

names from the HTML header

Data Wrangling

Data Wrangling is the process of cleaning and unifying messy and complex data sets for easy access and Exploratory Data Analysis (EDA).

First calculate the number of launches on each site, then calculate the number and occurrence of mission outcome per orbit type.

Then create a landing outcome label from the outcome column. This will make it easier for further analysis, visualization, and ML. Lastly, we will export the result to a CSV

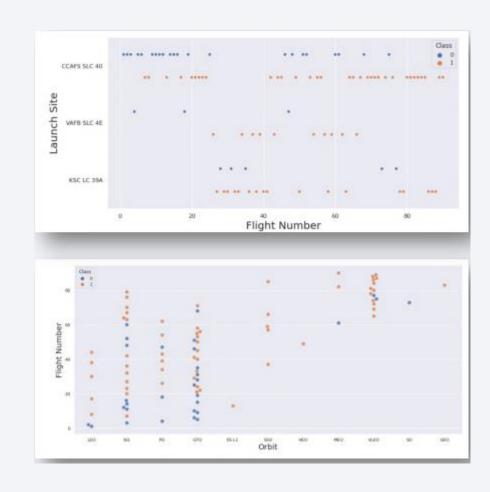

https://github.com/lessabruno/Data-Science-Capstone/blob/main/DataWrangling.ipynb

EDA with Data Visualization

First started by using scatter graph to find the relationship between the attributes such as between:

- Payload and Flight Number.
- Flight Number and Launch Site.
- Payload and Launch Site.
- Flight Number and Orbit Type.
- Payload and Orbit Type.

Scatter plots show dependency of attributes on each other. Once a pattern is determined from the graphs. It's very easy to see which factors affecting the most to the success of the landing outcomes.

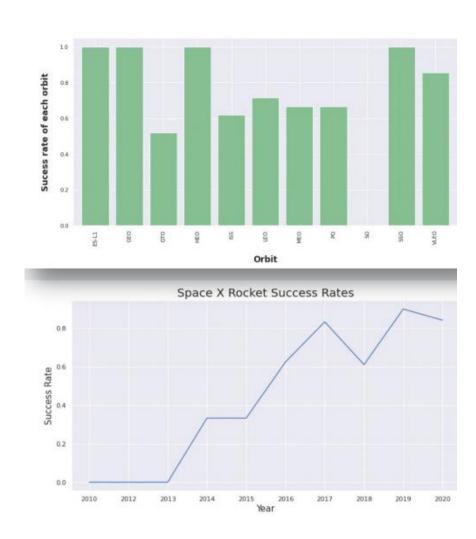

EDA with Data Visualization

Once we get a hint of the relationships using scatter plot.

Then use further visualization tools such as bar graph and line plots graph for further analysis. Bar graphs is one of the easiest way to interpret the relationship between the attributes. In this case, we will use the bar graph to determine which orbits have the highest probability of success.

Then use the line graph to show a trends or pattern of the attribute over time which in this case, is used for see the launch success yearly trend.

After use Feature Engineering to be used in success prediction in the future module by created the dummy variables to categorical columns

EDA with SQL

- Displaying the names of the launch sites.
- Displaying 5 records where launch sites begin with the string 'CCA'. –
- Displaying the total payload mass carried by booster launched by NASA (CRS). –
- Displaying the average payload mass carried by booster version F9 v1.1. –
- Listing the date when the first successful landing outcome in ground pad was achieved. –
- Listing the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000.
- Listing the total number of successful and failure mission outcomes.
- Listing the names of the booster_versions which have carried the maximum payload mass.
- Listing the failed landing_outcomes in drone ship, their booster versions, and launch sites names for in year 2015.
- - Rank the count of landing outcomes or success between the date 2010-06-04 and 2017-03-20, in descending order.

Build an Interactive Map with Folium

To visualize the launch data into an interactive map. We took the latitude and longitude coordinates at each launch site and added a circle marker around each launch site with a label of the name of the launch site.

Assigned the dataframe launch_outcomes(failure, success) to classes 0 and 1 with Red and Green markers on the map in MarkerCluster().

Used the Haversine's formula to calculated the distance of the launch sites to various landmark to find answer to the questions of:

- How close the launch sites with railways, highways and coastlines?
- How close the launch sites with nearby cities?

Build a Dashboard with Plotly Dash

- We built an interactive dashboard with Plotly dash which allowing the user to play around with the data as they need.
- We plotted pie charts showing the total launches by a certain sites.
- We then plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.

https://github.com/lessabruno/Data-Science-Capstone/blob/main/spaceYDashApp.py

Predictive Analysis (Classification)

Build Model

- Load Dataset
- Transform data
- Decide which MK use

Evaluate Model

- Check accuracy
- Tune parameters
- Plot confusion matrix

Improve Model

 Use Feature Engineering

Find the best model

 Best accuracy will be best model

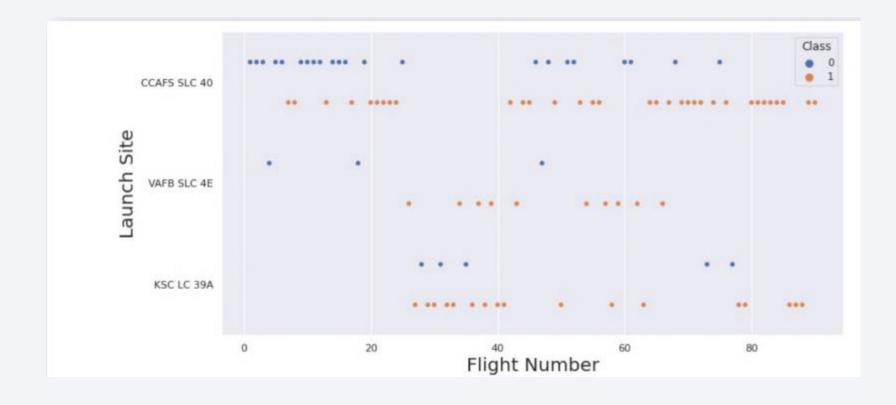

https://github.com/lessabruno/Data-Science-Capstone/blob/main/MachineLearningLab.ipynb

Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

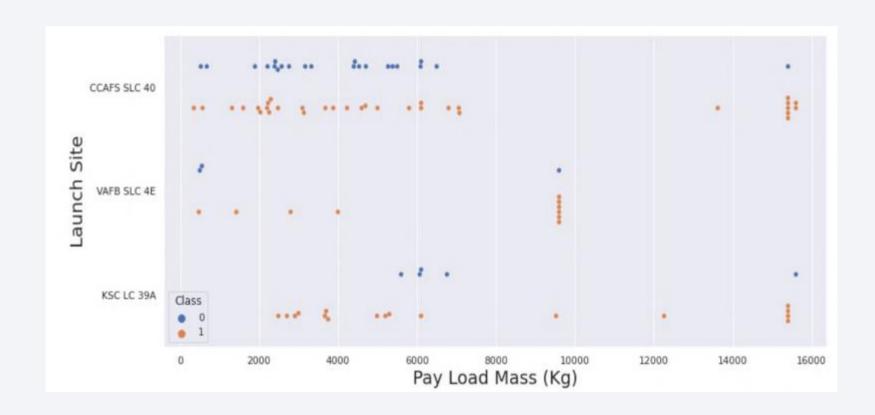

Flight Number vs. Launch Site

This scatter plot shows that the larger the flights amount of the launch site, the greater the success rate will be.

However, site CCAFS SLC40 shows the least pattern of this.

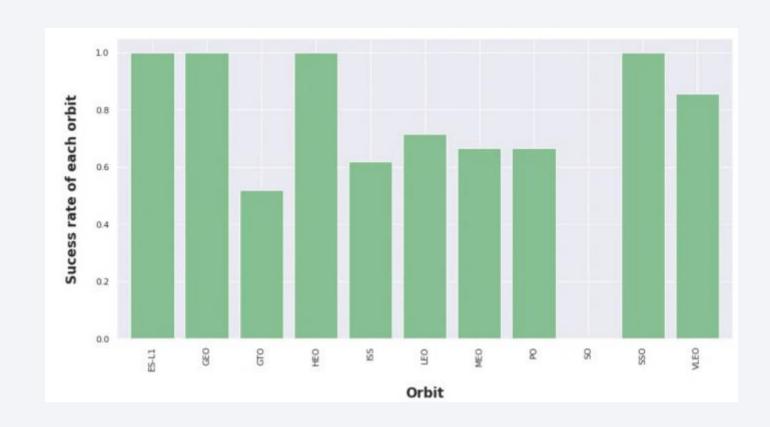

Payload vs. Launch Site

Once the pay load mass is greater than 7000kg, the probability of the success rate will be highly increased.

There is no clear pattern to say the launch site is dependent to the pay load mass for the success rate.

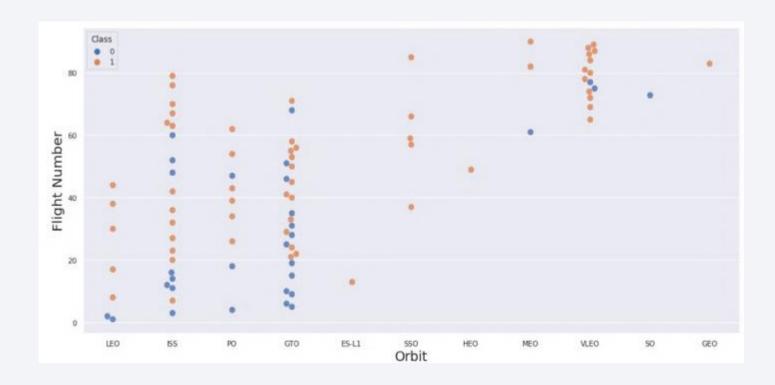

Success Rate vs. Orbit Type

This figure depicted the possibility of the orbits to influences the landing outcomes as some orbits has 100% success rate such as SSO, HEO, GEO AND ES-L1 while SO orbit produced 0% rate of success.

However, deeper analysis show that some of this orbits has only 1 occurrence such as GEO, SO, HEO and ES-L1 which mean this data need more dataset to see pattern or trend before we draw any conclusion.

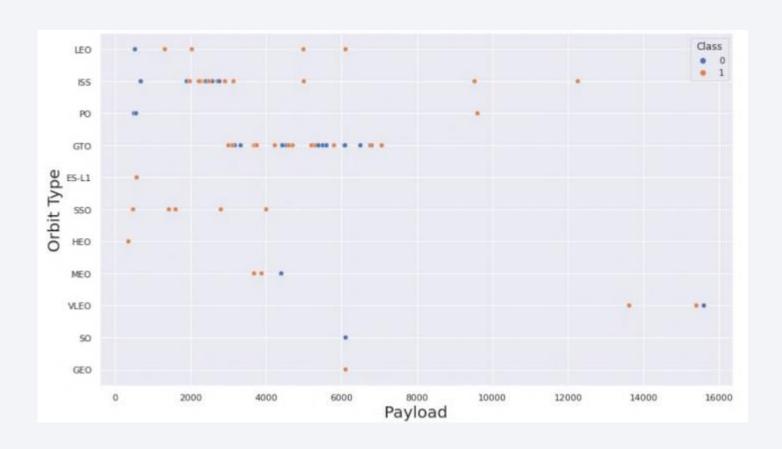

Flight Number vs. Orbit Type

This scatter plot shows that generally, the larger the flight number on each orbits, the greater the success rate (especially LEO orbit) except for GTO orbit which depicts no relationship between both attributes.

Orbit that only has 1 occurrence should also be excluded from above statement as it's needed more dataset.

Payload vs. Orbit Type

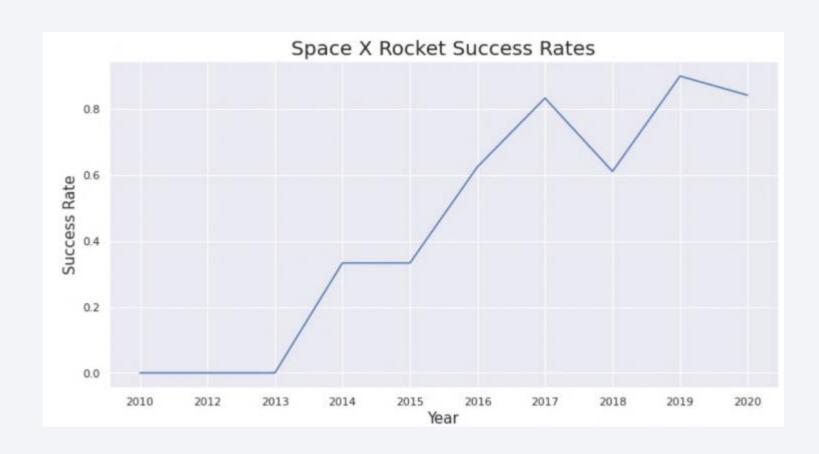

Heavier payload has positive impact on LEO, ISS and PO orbit. However, it has negative impact on MEO and VLEO orbit.

GTO orbit seem to depict no relation between the attributes.

Meanwhile, again, SO, GEO and HEO orbit need more dataset to see any pattern or trend.

Launch Success Yearly Trend

This figures clearly depicted and increasing trend from the year 2013 until 2020. If this trend continue for the next year onward.

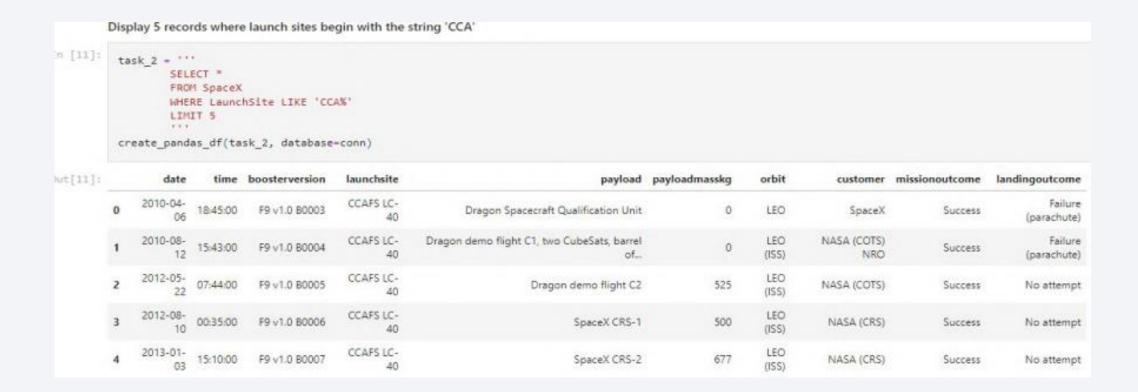

The success rate will steadily increase until reaching 1/100% success rate.

All Launch Site Names

SELECT DISTINCT launch_site FROM SPACEX : to show us unique launch sites.

Launch Site Names Begin with 'CCA'

Total Payload Mass

Used: **SELECT SUM(PAYLOAD_MASS_KG)**, to show the total Mass carried.

Total Payload Mass by NASA (CRS)

45596

Average Payload Mass by F9 v1.1

```
%sql SELECT AVG(PAYLOAD_MASS__KG_) AS "Average Payload Mass by Booster
WHERE BOOSTER_VERSION = 'F9 v1.1';
```

Average Payload Mass by Booster Version F9 v1.1

2928

First Successful Ground Landing Date

```
%sql SELECT MIN(DATE) AS "First Successful Landing Outcome in Ground Pac
WHERE LANDING_OUTCOME = 'Success (ground pad)';
```

First Succesful Landing Outcome in Ground Pad

2015-12-22

Successful Drone Ship Landing with Payload between 4000 and 6000

```
%sql SELECT BOOSTER_VERSION FROM SPACEX WHERE LANDING__OUTCOME = 'Success (drone ship)' \
AND PAYLOAD_MASS__KG_ > 4000 AND PAYLOAD_MASS__KG_ < 6000;</pre>
```

booster_version

F9 FT B1022

F9 FT B1026

F9 FT B1021.2

F9 FT B1031.2

Total Number of Successful and Failure Mission Outcomes

Boosters Carried Maximum Payload

*sql SELECT DISTINCT BOOSTER_VERSION AS "Booster Versions which carried the Maximum Payload Mass" FROM SPACEX
WHERE PAYLOAD_MASS__KG__=(SELECT MAX(PAYLOAD_MASS__KG_) FROM SPACEX);

Booster Versions which carried the Maximum	Payload Mass
	F9 B5 B1048.4
	F9 B5 B1048.5
	F9 B5 B1049.4
	F9 B5 B1049.5
	F9 B5 B1049.7
	F9 B5 B1051.3
	F9 B5 B1051.4
	F9 B5 B1051.6
	F9 B5 B1056.4
	F9 B5 B1058.3
	F9 B5 B1060.2
	F9 B5 B1060.3

2015 Launch Records

```
%sql SELECT BOOSTER_VERSION, LAUNCH_SITE FROM SPACEX WHERE DATE LIKE '2015-%' AND \
LANDING_OUTCOME = 'Failure (drone ship)';
```

booster_version	launch_site
F9 v1.1 B1012	CCAFS LC-40
F9 v1.1 B1015	CCAFS LC-40

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

```
$sql SELECT LANDING_OUTCOME as "Landing Outcome", COUNT(LANDING_OUTCOME) AS "Total Count" FROM SPACEX \
WHERE DATE BETWEEN '2010-06-04' AND '2017-03-20' \
GROUP BY LANDING_OUTCOME \
ORDER BY COUNT(LANDING OUTCOME) DESC;
```

Landing Outcome	Total Count
No attempt	10
Failure (drone ship)	5
Success (drone ship)	5
Controlled (ocean)	3
Success (ground pad)	3
Failure (parachute)	2
Uncontrolled (ocean)	2
Precluded (drone ship)	1

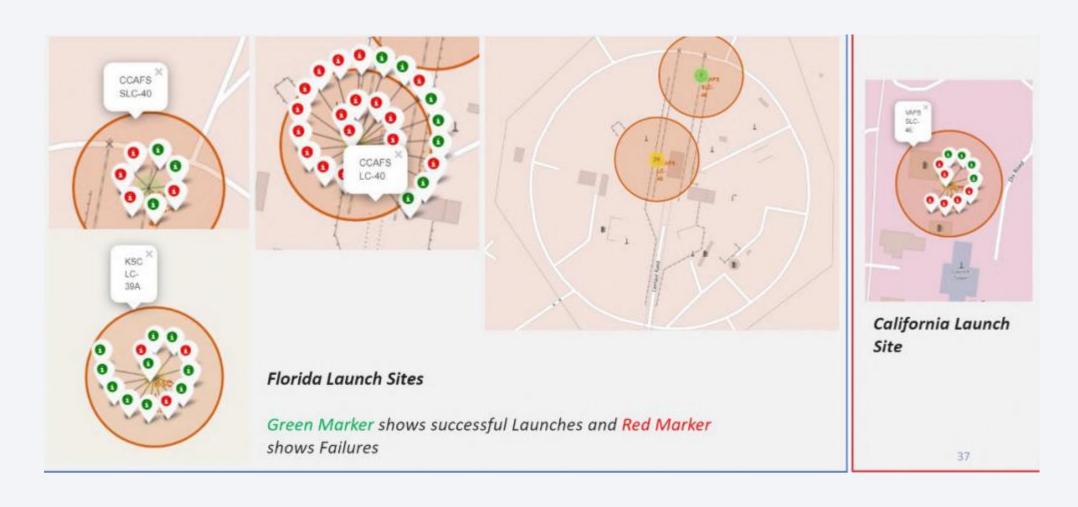

Launch Sites

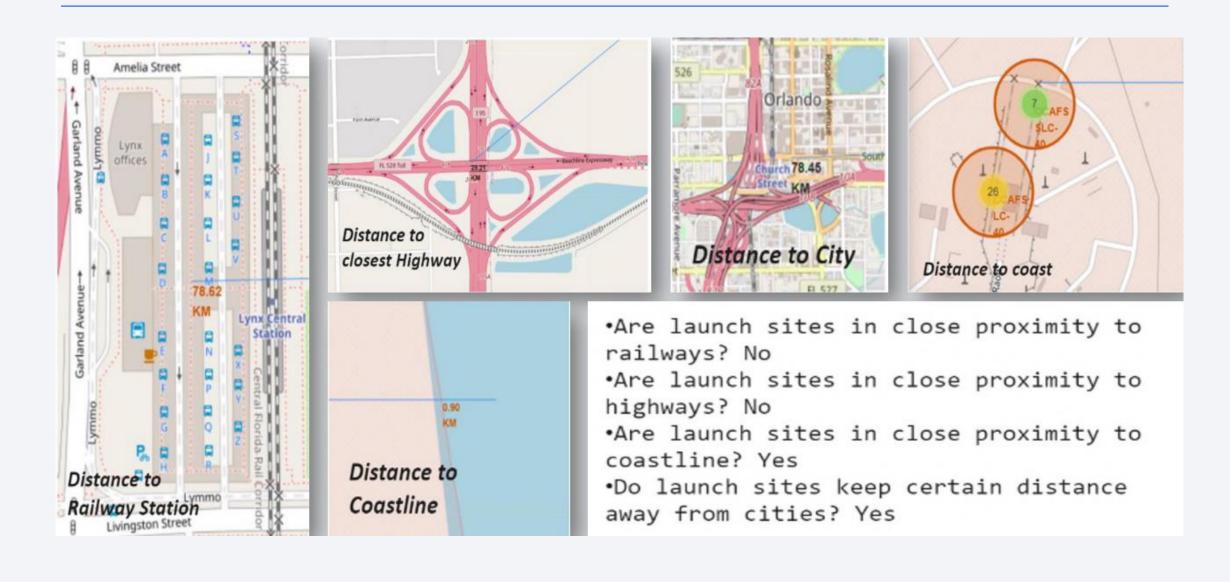

All launch sites are located in the United States

Launch Sites with colors labels

Launch Sites proximities

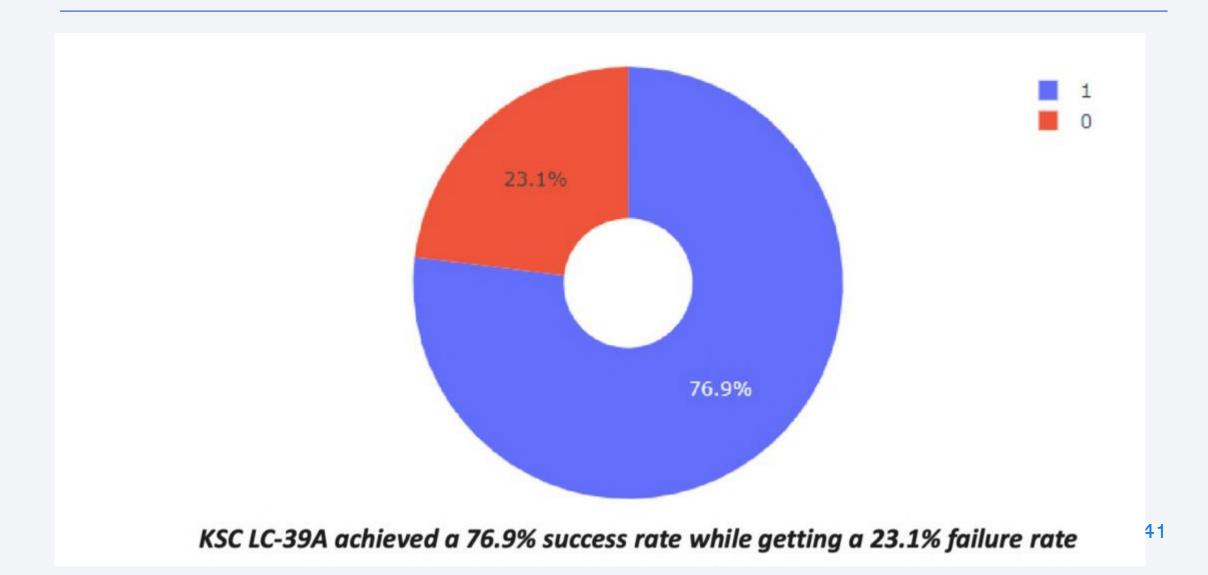

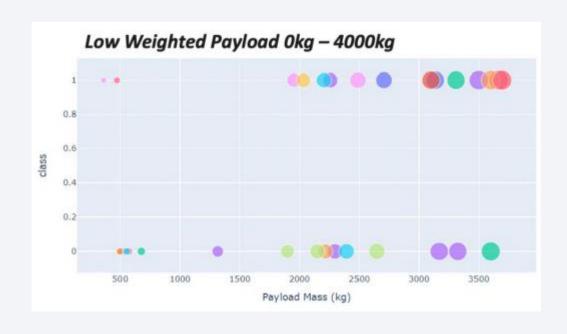

Launch success by site

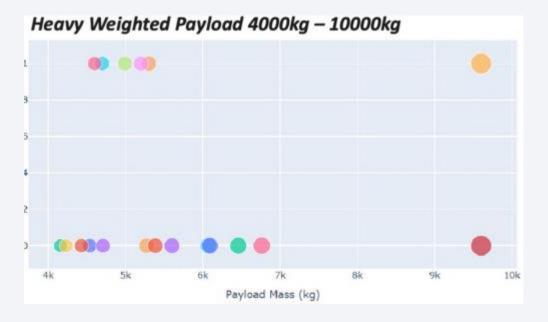

Highest success ratio

Payload vs Launch Outcome

All the success rate for low weighted payload is higher than heavy weighted payload.

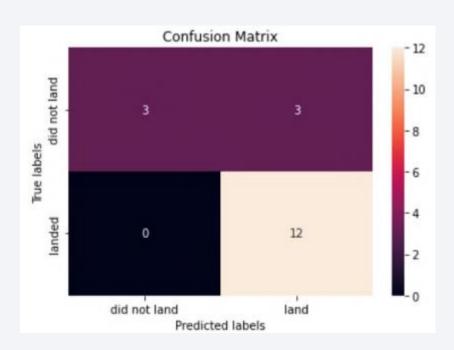

Classification Accuracy

```
Best Algorithm is Tree with a score of 0.9017857142857142

Best Params is : {'criterion': 'entropy', 'max_depth': 10, 'max_features': 'auto', 'min_samples_leaf': 2, 'min_samples_split': 10, 'splitter': 'random'}
```

Confusion Matrix

Conclusions

- The Tree Classifier Algorithm is the best Machine Learning approach for this dataset.
- The low weighted payloads (which define as 4000kg and below) performed better than the heavy weighted payloads.
- Starting from the year 2013, the success rate for SpaceX launches is increased, directly proportional time in years to 2020, which it will eventually perfect the launches in the future.
- KSC LC-39A have the most successful launches of any sites; 76.9%
- SSO orbit have the most success rate; 100% and more than 1 occurrence.
